FreeBSD Glossary

This glossary contains terms and acronyms used within the FreeBSD community and documentation.

A

ACL	See Access Control List .
ACPI	See Advanced Configuration and Power Interface .
AMD	See Automatic Mount Daemon .
AML	See ACPI Machine Language .
API	See Application Programming Interface .
APIC	See Advanced Programmable Interrupt Controller .
APM	See Advanced Power Management .
APOP	See Authenticated Post Office Protocol .
ASL	See ACPI Source Language .
ATA	See Advanced Technology Attachment .
ATM	See Asynchronous Transfer Mode .
ACPI Machine Language	Pseudocode, interpreted by a virtual machine within an ACPI-compliant operating system, providing a layer between the underlying hardware and the documented interface presented to the OS.
ACPI Source Language	The programming language AML is written in.
Access Control List	A list of permissions attached to an object, usually either a file or a network device.
Advanced Configuration and Power Interface	A specification which provides an abstraction of the interface the hardware presents to the operating system, so that the operating system should need to know nothing about the underlying hardware to make the most of it. ACPI evolves and supersedes the functionality provided previously by APM, PNPBIOS and other technologies, and provides facilities for controlling power consumption,

	machine suspension, device enabling and disabling, etc.
Application Programming Interface	A set of procedures, protocols and tools that specify the canonical interaction of one or more program parts; how, when and why they do work together, and what data they share or operate on.
Advanced Power Management	An API enabling the operating system to work in conjunction with the BIOS in order to achieve power management. APM has been superseded by the much more generic and powerful ACPI specification for most applications.
Advanced Programmable Interrupt Controller	
Advanced Technology Attachment	
Asynchronous Transfer Mode	
Authenticated Post Office Protocol	
Automatic Mount Daemon	A daemon that automatically mounts a filesystem when a file or directory within that filesystem is accessed.

B

BAR	See Base Address Register .
BIND	See Berkeley Internet Name Domain .
BIOS	See Basic Input/Output System .
BSD	See Berkeley Software Distribution .
Base Address Register	The registers that determine which address range a PCI device will respond to.
Basic Input/Output System	The definition of BIOS depends a bit on the context. Some people refer to it as the ROM chip with a basic set of routines to provide an interface between software and hardware. Others refer to it as the set of routines contained in the chip that help in bootstrapping the system. Some might also refer to it as the screen used to configure the bootstrapping

	process. The BIOS is PC-specific but other systems have something similar.
Berkeley Internet Name Domain	An implementation of the DNS protocols.
Berkeley Software Distribution	This is the name that the Computer Systems Research Group (CSRG) at The University of California at Berkeley gave to their improvements and modifications to AT&T's 32V UNIX®. FreeBSD is a descendant of the CSRG work.
Bikeshed Building	A phenomenon whereby many people will give an opinion on an uncomplicated topic, whilst a complex topic receives little or no discussion. See the FAQ for the origin of the term.

C

CD	See Carrier Detect .
CHAP	See Challenge Handshake Authentication Protocol .
CLIP	See Classical IP over ATM .
COFF	See Common Object File Format .
CPU	See Central Processing Unit .
CTS	See Clear To Send .
CVS	See Concurrent Versions System .
Carrier Detect	An RS232C signal indicating that a carrier has been detected.
Central Processing Unit	Also known as the processor. This is the brain of the computer where all calculations take place. There are a number of different architectures with different instruction sets. Among the more well-known are the Intel-x86 and derivatives, Sun SPARC, PowerPC, and Alpha.
Challenge Handshake Authentication Protocol	A method of authenticating a user, based on a secret shared between client and server.
Classical IP over ATM	
Clear To Send	An RS232C signal giving the remote system permission to send data.

See Also [Request To Send](#).

Common Object File Format

Concurrent Versions System

A version control system, providing a method of working with and keeping track of many different revisions of files. CVS provides the ability to extract, merge and revert individual changes or sets of changes, and offers the ability to keep track of which changes were made, by who and for what reason.

D

DAC

See [Discretionary Access Control](#).

DDB

See [Debugger](#).

DES

See [Data Encryption Standard](#).

DHCP

See [Dynamic Host Configuration Protocol](#).

DNS

See [Domain Name System](#).

DSDT

See [Differentiated System Description Table](#).

DSR

See [Data Set Ready](#).

DTR

See [Data Terminal Ready](#).

DVMRP

See [Distance-Vector Multicast Routing Protocol](#).

Discretionary Access Control

Data Encryption Standard

A method of encrypting information, traditionally used as the method of encryption for UNIX® passwords and the [crypt\(3\)](#) function.

Data Set Ready

An RS232C signal sent from the modem to the computer or terminal indicating a readiness to send and receive data.

See Also [Data Terminal Ready](#).

Data Terminal Ready

An RS232C signal sent from the computer or terminal to the modem indicating a readiness to send and receive data.

Debugger

An interactive in-kernel facility for examining the status of a system, often used after a system has

	crashed to establish the events surrounding the failure.
Differentiated System Description Table	An ACPI table, supplying basic configuration information about the base system.
Distance-Vector Multicast Routing Protocol	
Domain Name System	The system that converts humanly readable hostnames (i.e., mail.example.net) to Internet addresses and vice versa.
Dynamic Host Configuration Protocol	A protocol that dynamically assigns IP addresses to a computer (host) when it requests one from the server. The address assignment is called a “lease”.

E

ECOFF	See Extended COFF .
ELF	See Executable and Linking Format .
ESP	See Encapsulated Security Payload .
Encapsulated Security Payload	
Executable and Linking Format	
Extended COFF	

F

FADT	See Fixed ACPI Description Table .
FAT	See File Allocation Table .
FAT16	See File Allocation Table (16-bit) .
FTP	See File Transfer Protocol .
File Allocation Table	
File Allocation Table (16-bit)	
File Transfer Protocol	A member of the family of high-level protocols implemented on top of TCP which can be used to transfer files over a TCP/IP network.

Fixed ACPI Description Table

G

GUI See [Graphical User Interface](#).

Giant The name of a mutual exclusion mechanism (a `sleep mutex`) that protects a large set of kernel resources. Although a simple locking mechanism was adequate in the days where a machine might have only a few dozen processes, one networking card, and certainly only one processor, in current times it is an unacceptable performance bottleneck. FreeBSD developers are actively working to replace it with locks that protect individual resources, which will allow a much greater degree of parallelism for both single-processor and multi-processor machines.

Graphical User Interface A system where the user and computer interact with graphics.

H

HTML See [HyperText Markup Language](#).

HUP See [HangUp](#).

HangUp

HyperText Markup Language The markup language used to create web pages.

I

I/O See [Input/Output](#).

IASL See [Intel's ASL compiler](#).

IMAP See [Internet Message Access Protocol](#).

IP See [Internet Protocol](#).

IPFW See [IP Firewall](#).

IPP See [Internet Printing Protocol](#).

IPv4	See IP Version 4 .
IPv6	See IP Version 6 .
ISP	See Internet Service Provider .
IP Firewall	
IP Version 4	The IP protocol version 4, which uses 32 bits for addressing. This version is still the most widely used, but it is slowly being replaced with IPv6. See Also IP Version 6 .
IP Version 6	The new IP protocol. Invented because the address space in IPv4 is running out. Uses 128 bits for addressing.
Input/Output	
Intel's ASL compiler	Intel's compiler for converting ASL into AML.
Internet Message Access Protocol	A protocol for accessing email messages on a mail server, characterised by the messages usually being kept on the server as opposed to being downloaded to the mail reader client. See Also Post Office Protocol Version 3 .
Internet Printing Protocol	
Internet Protocol	The packet transmitting protocol that is the basic protocol on the Internet. Originally developed at the U.S. Department of Defense and an extremely important part of the TCP/IP stack. Without the Internet Protocol, the Internet would not have become what it is today. For more information, see RFC 791 .
Internet Service Provider	A company that provides access to the Internet.

K

KAME	Japanese for “turtle”, the term KAME is used in computing circles to refer to the KAME Project , who work on an implementation of IPv6.
KDC	See Key Distribution Center .
KLD	See Kernel ld(1) .

KSE	See Kernel Scheduler Entities .
KVA	See Kernel Virtual Address .
Kbps	See Kilo Bits Per Second .
Kernel ld(1)	A method of dynamically loading functionality into a FreeBSD kernel without rebooting the system.
Kernel Scheduler Entities	A kernel-supported threading system. See the project home page for further details.
Kernel Virtual Address	
Key Distribution Center	
Kilo Bits Per Second	Used to measure bandwidth (how much data can pass a given point at a specified amount of time). Alternates to the Kilo prefix include Mega, Giga, Tera, and so forth.

L

LAN	See Local Area Network .
LOR	See Lock Order Reversal .
LPD	See Line Printer Daemon .
Line Printer Daemon	
Local Area Network	A network used on a local area, e.g. office, home, or so forth.
Lock Order Reversal	<p>The FreeBSD kernel uses a number of resource locks to arbitrate contention for those resources. A run-time lock diagnostic system found in FreeBSD-CURRENT kernels (but removed for releases), called witness(4), detects the potential for deadlocks due to locking errors. (witness(4) is actually slightly conservative, so it is possible to get false positives.) A true positive report indicates that “if you were unlucky, a deadlock would have happened here”.</p> <p>True positive LORs tend to get fixed quickly, so check http://lists.FreeBSD.org/mailman/listinfo/freebsd-current and the LORs Seen page before posting to the mailing lists.</p>

M

MAC	See Mandatory Access Control .
MADT	See Multiple APIC Description Table .
MFC	See Merge From Current .
MFP4	See Merge From Perforce .
MFS	See Merge From Stable .
MIT	See Massachusetts Institute of Technology .
MLS	See Multi-Level Security .
MOTD	See Message Of The Day .
MTA	See Mail Transfer Agent .
MUA	See Mail User Agent .
Mail Transfer Agent	An application used to transfer email. An MTA has traditionally been part of the BSD base system. Today Sendmail is included in the base system, but there are many other MTAs, such as postfix, qmail and Exim.
Mail User Agent	An application used by users to display and write email.
Mandatory Access Control	
Massachusetts Institute of Technology	
Merge From Current	To merge functionality or a patch from the -CURRENT branch to another, most often -STABLE.
Merge From Perforce	To merge functionality or a patch from the Perforce repository to the -CURRENT branch. See Also Perforce .
Merge From Stable	In the normal course of FreeBSD development, a change will be committed to the -CURRENT branch for testing before being merged to -STABLE. On rare occasions, a change will go into -STABLE first and then be merged to -CURRENT.

This term is also used when a patch is merged from -STABLE to a security branch.

See Also [Merge From Current](#).

Message Of The Day

A message, usually shown on login, often used to distribute information to users of the system.

Multi-Level Security

Multiple APIC Description Table

N

NAT

See [Network Address Translation](#).

NDISulator

See [Project Evil](#).

NFS

See [Network File System](#).

NTFS

See [New Technology File System](#).

NTP

See [Network Time Protocol](#).

Network Address Translation

A technique where IP packets are rewritten on the way through a gateway, enabling many machines behind the gateway to effectively share a single IP address.

Network File System

New Technology File System

A filesystem developed by Microsoft and available in its “New Technology” operating systems, such as Windows® 2000, Windows NT® and Windows® XP.

Network Time Protocol

A means of synchronizing clocks over a network.

O

OBE

See [Overtaken By Events](#).

ODMR

See [On-Demand Mail Relay](#).

OS

See [Operating System](#).

On-Demand Mail Relay

Operating System

A set of programs, libraries and tools that provide access to the hardware resources of a computer. Op-

erating systems range today from simplistic designs that support only one program running at a time, accessing only one device to fully multi-user, multi-tasking and multi-process systems that can serve thousands of users simultaneously, each of them running dozens of different applications.

Overtaken By Events

Indicates a suggested change (such as a Problem Report or a feature request) which is no longer relevant or applicable due to such things as later changes to FreeBSD, changes in networking standards, the affected hardware having since become obsolete, and so forth.

P

p4

See [Perforce](#).

PAE

See [Physical Address Extensions](#).

PAM

See [Pluggable Authentication Modules](#).

PAP

See [Password Authentication Protocol](#).

PC

See [Personal Computer](#).

PCNSFD

See [Personal Computer Network File System Daemon](#).

PDF

See [Portable Document Format](#).

PID

See [Process ID](#).

POLA

See [Principle Of Least Astonishment](#).

POP

See [Post Office Protocol](#).

POP3

See [Post Office Protocol Version 3](#).

PPD

See [PostScript Printer Description](#).

PPP

See [Point-to-Point Protocol](#).

PPPoA

See [PPP over ATM](#).

PPPoE

See [PPP over Ethernet](#).

PPP over ATM

PPP over Ethernet

PR See [Problem Report](#).

PXE See [Preboot eXecution Environment](#).

Password Authentication Protocol

Perforce A source code control product made by [Perforce Software](#) which is more advanced than CVS. Although not open source, its use is free of charge to open-source projects such as FreeBSD.

Some FreeBSD developers use a Perforce repository as a staging area for code that is considered too experimental for the -CURRENT branch.

Personal Computer

Personal Computer Network File System Daemon

Physical Address Extensions A method of enabling access to up to 64 GB of RAM on systems which only physically have a 32-bit wide address space (and would therefore be limited to 4 GB without PAE).

Pluggable Authentication Modules

Point-to-Point Protocol

Pointy Hat A mythical piece of headgear, much like a dunce cap, awarded to any FreeBSD committer who breaks the build, makes revision numbers go backwards, or creates any other kind of havoc in the source base. Any committer worth his or her salt will soon accumulate a large collection. The usage is (almost always?) humorous.

Portable Document Format

Post Office Protocol See Also [Post Office Protocol Version 3](#).

Post Office Protocol Version 3 A protocol for accessing email messages on a mail server, characterised by the messages usually being downloaded from the server to the client, as opposed to remaining on the server.

See Also [Internet Message Access Protocol](#).

PostScript Printer Description

Preboot eXecution Environment

Principle Of Least Astonishment As FreeBSD evolves, changes visible to the user should be kept as unsurprising as possible. For example, arbitrarily rearranging system startup variables in `/etc/defaults/rc.conf` violates PO-LA. Developers consider POLA when contemplating user-visible system changes.

Problem Report A description of some kind of problem that has been found in either the FreeBSD source or documentation. See [Writing FreeBSD Problem Reports](#).

Process ID A number, unique to a particular process on a system, which identifies it and allows actions to be taken against it.

Project Evil The working title for the NDISulator, written by Bill Paul, who named it referring to how awful it is (from a philosophical standpoint) to need to have something like this in the first place. The NDISulator is a special compatibility module to allow Microsoft Windows™ NDIS miniport network drivers to be used with FreeBSD/i386. This is usually the only way to use cards where the driver is closed-source. See `src/sys/compat/ndis/subr_ndis.c` .

R

RA See [Router Advertisement](#).

RAID See [Redundant Array of Inexpensive Disks](#).

RAM See [Random Access Memory](#).

RD See [Received Data](#).

RFC See [Request For Comments](#).

RISC See [Reduced Instruction Set Computer](#).

RPC See [Remote Procedure Call](#).

RS232C See [Recommended Standard 232C](#).

RTS	See Request To Send .
Random Access Memory	
Revision Control System	<p>The <i>Revision Control System</i> (RCS) is one of the oldest software suites that implement “revision control” for plain files. It allows the storage, retrieval, archival, logging, identification and merging of multiple revisions for each file. RCS consists of many small tools that work together. It lacks some of the features found in more modern revision control systems, like CVS or Subversion, but it is very simple to install, configure, and start using for a small set of files. Implementations of RCS can be found on every major UNIX-like OS.</p> <p>See Also Concurrent Versions System, Subversion.</p>
Received Data	<p>An RS232C pin or wire that data is received on.</p> <p>See Also Transmitted Data.</p>
Recommended Standard 232C	A standard for communications between serial devices.
Reduced Instruction Set Computer	<p>An approach to processor design where the operations the hardware can perform are simplified but made as general purpose as possible. This can lead to lower power consumption, fewer transistors and in some cases, better performance and increased code density. Examples of RISC processors include the Alpha, SPARC®, ARM® and PowerPC®.</p>
Redundant Array of Inexpensive Disks	
Remote Procedure Call	
repocopy	See Repository Copy .
Repository Copy	<p>A direct copying of files within the CVS repository.</p> <p>Without a repocopy, if a file needed to be copied or moved to another place in the repository, the committer would run <code>cvsv add</code> to put the file in its new location, and then <code>cvsv rm</code> on the old file if the old copy was being removed.</p> <p>The disadvantage of this method is that the history (i.e. the entries in the CVS logs) of the file would not be copied to the new location. As the FreeBSD</p>

Project considers this history very useful, a repository copy is often used instead. This is a process where one of the repository masters will copy the files directly within the repository, rather than using the [cvs\(1\)](#) program.

Request For Comments

A set of documents defining Internet standards, protocols, and so forth. See www.rfc-editor.org.

Also used as a general term when someone has a suggested change and wants feedback.

Request To Send

An RS232C signal requesting that the remote system commences transmission of data.

See Also [Clear To Send](#).

Router Advertisement

S

SCI

See [System Control Interrupt](#).

SCSI

See [Small Computer System Interface](#).

SG

See [Signal Ground](#).

SMB

See [Server Message Block](#).

SMP

See [Symmetric MultiProcessor](#).

SMTP

See [Simple Mail Transfer Protocol](#).

SMTP AUTH

See [SMTP Authentication](#).

SSH

See [Secure Shell](#).

STR

See [Suspend To RAM](#).

SVN

See [Subversion](#).

SMTP Authentication

Server Message Block

Signal Ground

An RS232 pin or wire that is the ground reference for the signal.

Simple Mail Transfer Protocol

Secure Shell

Small Computer System Interface

Subversion

Subversion is a version control system, similar to CVS, but with an expanded feature list.
See Also [Concurrent Versions System](#).

Suspend To RAM

Symmetric MultiProcessor

System Control Interrupt

T

TCP

See [Transmission Control Protocol](#).

TCP/IP

See [Transmission Control Protocol/Internet Protocol](#).

TD

See [Transmitted Data](#).

TFTP

See [Trivial FTP](#).

TGT

See [Ticket-Granting Ticket](#).

TSC

See [Time Stamp Counter](#).

Ticket-Granting Ticket

Time Stamp Counter

A profiling counter internal to modern Pentium® processors that counts core frequency clock ticks.

Transmission Control Protocol

A protocol that sits on top of (e.g.) the IP protocol and guarantees that packets are delivered in a reliable, ordered, fashion.

Transmission Control Protocol/Internet Protocol

The term for the combination of the TCP protocol running over the IP protocol. Much of the Internet runs over TCP/IP.

Transmitted Data

An RS232C pin or wire that data is transmitted on.
See Also [Received Data](#).

Trivial FTP

U

UDP

See [User Datagram Protocol](#).

1960

UFS1	See Unix File System Version 1 .
UFS2	See Unix File System Version 2 .
UID	See User ID .
URL	See Uniform Resource Locator .
USB	See Universal Serial Bus .
Uniform Resource Locator	A method of locating a resource, such as a document on the Internet and a means to identify that resource.
Unix File System Version 1	The original UNIX® file system, sometimes called the Berkeley Fast File System.
Unix File System Version 2	An extension to UFS1, introduced in FreeBSD 5-CURRENT. UFS2 adds 64 bit block pointers (breaking the 1T barrier), support for extended file storage and other features.
Universal Serial Bus	A hardware standard used to connect a wide variety of computer peripherals to a universal interface.
User ID	A unique number assigned to each user of a computer, by which the resources and permissions assigned to that user can be identified.
User Datagram Protocol	A simple, unreliable datagram protocol which is used for exchanging data on a TCP/IP network. UDP does not provide error checking and correction like TCP.

V

VPN	See Virtual Private Network .
Virtual Private Network	A method of using a public telecommunication such as the Internet, to provide remote access to a localized network, such as a corporate LAN.

Colophon

This book is the combined work of hundreds of contributors to “The FreeBSD Documentation Project”. The text is authored in XML according to the DocBook DTD and is formatted from XML into many different presentation formats using XSLT. The printed version of this document would not be possible without Donald Knuth's TeX typesetting language, Leslie Lamport's LaTeX, or Sebastian Rahtz's JadeTeX macro package.
